(Claims 09)

A backlight apparatus for use in a flat panel electronic display, said display having a modulating means for providing an image to a remotely positioned observer, and said backlight apparatus comprising: a) a light generating means as herein described for generating a first source of light rays; b) a light transmitting means having a first light accepting surface in close proximity to said light generating means, wherein said light transmitting means transports the light rays emanating from said light generating means in a direction substantially parallel to the viewing plane of said modulating means; c) reflecting means for collimating said light rays, said reflecting means disposed between said light transmitting means and said modulating means and said reflecting means comprising an array of microprisms and each microprism comprising: (i) a light input surface optically coupled to said light transmitting means (ii) a light output surface distal from and parallel to said light input surface; and (iii) a first sidewall disposed between and contiguous with said light input surface and said light output surface and forming a tilt angle with respect to the normal of the surface of said light transmitting means and positioned for effecting total reflection of said light rays received by said input surface; whereby said light rays internally reflected by said sidewall emerge through said light output surface in a direction substantially perpendicular to said modulating means.

(6 Claims)

An optical element for use in display arrangement comprising:

a truncated symmetrical solid member consisting of a light input surface, a light output surface and sides, characterised in that

said light input surface and said light output surface are interconnected by said sides of said truncated symmetrical solid member,

wherein said light output surface and said light input surface have different areas and

ratio of area of said light output surface to the area of said light input surface varies between 0.1 and 0.3,

said sides of said truncated symmetrical solid member taper inwardly from said light input surface to said light output surface at an angle ranging between 7.5 degrees and 17.5 degrees,

wherein the fraction of light entering said light input surface which exits the said light output surface varies as a function of said ratio and said angle;

and

the angular distribution of the light exiting the said light output surface varies as function of said ratio and said angle,
